# How to find the eigenvalues of a matrix?

# How to find the eigenvalues of a matrix?

- The secret lies in that the equation  $(A - \lambda I)\mathbf{x} = \mathbf{0}$  has nontrivial solution.

# How to find the eigenvalues of a matrix?

- The secret lies in that the equation  $(A - \lambda I)\mathbf{x} = \mathbf{0}$  has nontrivial solution.
- Or  $A - \lambda I$  is not invertible (singular)

# How to find the eigenvalues of a matrix?

- The secret lies in that the equation  $(A - \lambda I)\mathbf{x} = \mathbf{0}$  has nontrivial solution.
- Or  $A - \lambda I$  is not invertible (singular)
- Recall the Invertible Matrix Theorem: A matrix is invertible if and only if its **determinant is nonzero**.

# Characteristic Equation

A scalar  $\lambda$  is an eigenvalue of an  $n \times n$  matrix  $A$  **if and only if**  $\lambda$  satisfies the **characteristic equation**

$$\det(A - \lambda I) = 0$$

## Example

Find the characteristic equation of

$$A = \begin{bmatrix} 5 & -2 & 6 & -1 \\ 0 & 2 & -8 & 0 \\ 0 & 0 & 5 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

- The eigenvalues of a triangular matrix are the entries on its main diagonal.

# Characteristic polynomial

- **Characteristic polynomial** of  $A$ :  $\det(A - \lambda I)$ , a polynomial of degree  $n$ .

# Characteristic polynomial

- **Characteristic polynomial** of  $A$ :  $\det(A - \lambda I)$ , a polynomial of degree  $n$ .
- **(Algebraic) multiplicity** of an eigenvalue  $\lambda$ : its multiplicity as a root of the characteristic equation

## Example

The characteristic polynomial of a  $6 \times 6$  matrix is  $\lambda^6 - 4\lambda^5 - 12\lambda^4$ . Find the eigenvalues and their multiplicities.

# Exercises

- If  $x$  is an eigenvector of  $A$  corresponding to  $\lambda$ , what is  $A^3x$ ?
- If  $A$  is an  $n \times n$  matrix and  $\lambda$  is an eigenvalue of  $A$ , show that  $2\lambda$  is an eigenvalue of  $2A$ .
- Find the characteristic equation and eigenvalues of

$$A = \begin{bmatrix} 1 & -4 \\ 4 & 2 \end{bmatrix}$$

- If  $A^2 = I$ , show that the eigenvalues of  $A$  can only be 1 or -1

# Outline

- 1 The Characteristic Equation
- 2 Eigenvalues, Trace and Determinant
- 3 Similarity

# Eigenvalues

- Since the characteristic equation of an  $n \times n$  matrix involves a polynomial of degree  $n$ , the equation always has exactly  $n$  roots, **counting mutiplicities, provided that possibly complex roots are included.**

# Eigenvalues

- Since the characteristic equation of an  $n \times n$  matrix involves a polynomial of degree  $n$ , the equation always has exactly  $n$  roots, **counting multiplicities, provided that possibly complex roots are included.**
- The complex eigenvalues of a real matrix will appear in conjugate pair.

# Eigenvalues

- Since the characteristic equation of an  $n \times n$  matrix involves a polynomial of degree  $n$ , the equation always has exactly  $n$  roots, **counting multiplicities, provided that possibly complex roots are included.**
- The complex eigenvalues of a real matrix will appear in conjugate pair.
- If a real matrix  $A$  has complex eigenvalue  $\lambda$ , then the corresponding eigenvectors are also complex.

# Eigenvalues, Trace and Determinant

$$\det(\lambda I - A) = \lambda^n + a_{n-1}\lambda^{n-1} + \cdots + a_1\lambda + a_0$$

# Eigenvalues, Trace and Determinant

$$\begin{aligned}\det(\lambda I - A) &= \lambda^n + a_{n-1}\lambda^{n-1} + \cdots + a_1\lambda + a_0 \\ &= \lambda^n - (a_{11} + a_{22} + \cdots + a_{nn})\lambda^{n-1} + \cdots + (-1)^n \det A\end{aligned}$$

# Eigenvalues, Trace and Determinant

$$\begin{aligned}\det(\lambda I - A) &= \lambda^n + a_{n-1}\lambda^{n-1} + \cdots + a_1\lambda + a_0 \\ &= \lambda^n - (a_{11} + a_{22} + \cdots + a_{nn})\lambda^{n-1} + \cdots + (-1)^n \det A \\ &= (\lambda - \lambda_1)(\lambda - \lambda_2) \cdots (\lambda - \lambda_n)\end{aligned}$$

# Eigenvalues, Trace and Determinant

$$\begin{aligned}\det(\lambda I - A) &= \lambda^n + a_{n-1}\lambda^{n-1} + \cdots + a_1\lambda + a_0 \\ &= \lambda^n - (a_{11} + a_{22} + \cdots + a_{nn})\lambda^{n-1} + \cdots + (-1)^n \det A \\ &= (\lambda - \lambda_1)(\lambda - \lambda_2) \cdots (\lambda - \lambda_n) \\ &= \lambda^n - (\lambda_1 + \cdots + \lambda_n)\lambda^{n-1} + \cdots + (-1)^n \lambda_1 \cdots \lambda_n\end{aligned}$$

# Eigenvalues, Trace and Determinant

$$\begin{aligned}\det(\lambda I - A) &= \lambda^n + a_{n-1}\lambda^{n-1} + \cdots + a_1\lambda + a_0 \\ &= \lambda^n - (a_{11} + a_{22} + \cdots + a_{nn})\lambda^{n-1} + \cdots + (-1)^n \det A \\ &= (\lambda - \lambda_1)(\lambda - \lambda_2) \cdots (\lambda - \lambda_n) \\ &= \lambda^n - (\lambda_1 + \cdots + \lambda_n)\lambda^{n-1} + \cdots + (-1)^n \lambda_1 \cdots \lambda_n\end{aligned}$$

- **Trace:**  $\lambda_1 + \cdots + \lambda_n = a_{11} + a_{22} + \cdots + a_{nn} = \text{tr}(A)$

# Eigenvalues, Trace and Determinant

$$\begin{aligned}\det(\lambda I - A) &= \lambda^n + a_{n-1}\lambda^{n-1} + \cdots + a_1\lambda + a_0 \\ &= \lambda^n - (a_{11} + a_{22} + \cdots + a_{nn})\lambda^{n-1} + \cdots + (-1)^n \det A \\ &= (\lambda - \lambda_1)(\lambda - \lambda_2) \cdots (\lambda - \lambda_n) \\ &= \lambda^n - (\lambda_1 + \cdots + \lambda_n)\lambda^{n-1} + \cdots + (-1)^n \lambda_1 \cdots \lambda_n\end{aligned}$$

- **Trace:**  $\lambda_1 + \cdots + \lambda_n = a_{11} + a_{22} + \cdots + a_{nn} = \text{tr}(A)$
- **Determinant:**  $\lambda_1 \cdots \lambda_n = \det A$

# Outline

- 3 Similarity**

## Similarity

- If  $A$  and  $B$  are  $n \times n$  matrices, then  $A$  is similar to  $B$  if there is an invertible matrix  $P$  such that  $P^{-1}AP = B$ , or, equivalently  $A = PBP^{-1}$ .

## Similarity

- If  $A$  and  $B$  are  $n \times n$  matrices, then  $A$  is similar to  $B$  if there is an invertible matrix  $P$  such that  $P^{-1}AP = B$ , or, equivalently  $A = PBP^{-1}$ .
- Writing  $Q$  for  $P^{-1}$ , we have  $Q^{-1}BQ = A$ . So  $B$  is also similar to  $A$ , and we say simply that  $A$  and  $B$  are similar.

## Similarity

- If  $A$  and  $B$  are  $n \times n$  matrices, then  $A$  is similar to  $B$  if there is an invertible matrix  $P$  such that  $P^{-1}AP = B$ , or, equivalently  $A = PBP^{-1}$ .
- Writing  $Q$  for  $P^{-1}$ , we have  $Q^{-1}BQ = A$ . So  $B$  is also similar to  $A$ , and we say simply that  $A$  and  $B$  are similar.
- Changing  $A$  into  $P^{-1}AP$  is called a **similarity transformation**.

## Theorem

If  $n \times n$  matrices  $A$  and  $B$  are similar, then they have **the same** characteristic polynomial and hence the same eigenvalues (with the same multiplicities).

## Theorem

If  $n \times n$  matrices  $A$  and  $B$  are similar, then they have **the same** characteristic polynomial and hence the same eigenvalues (with the same multiplicities).

- Are the matrices  $\begin{bmatrix} 2 & 1 \\ 0 & 2 \end{bmatrix}$  and  $\begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}$  similar?

## Theorem

If  $n \times n$  matrices  $A$  and  $B$  are similar, then they have **the same** characteristic polynomial and hence the same eigenvalues (with the same multiplicities).

- Are the matrices  $\begin{bmatrix} 2 & 1 \\ 0 & 2 \end{bmatrix}$  and  $\begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}$  similar?
- Row operations on a matrix usually change its eigenvalues.
